

Lab 3 - SQL&GPT: Deploy Application and test SQL Writing & Data Analysis Assistants

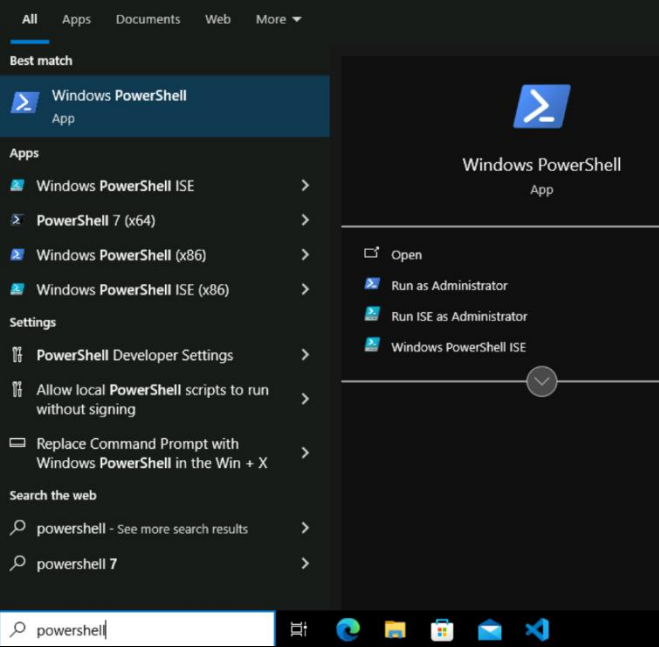

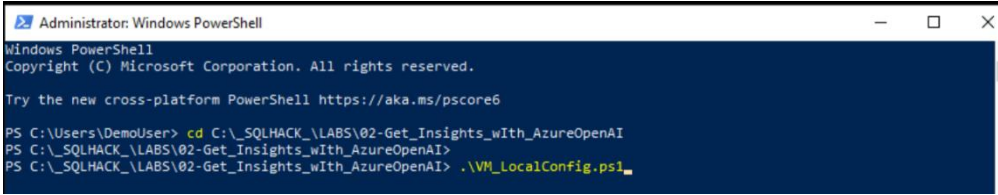

Contents

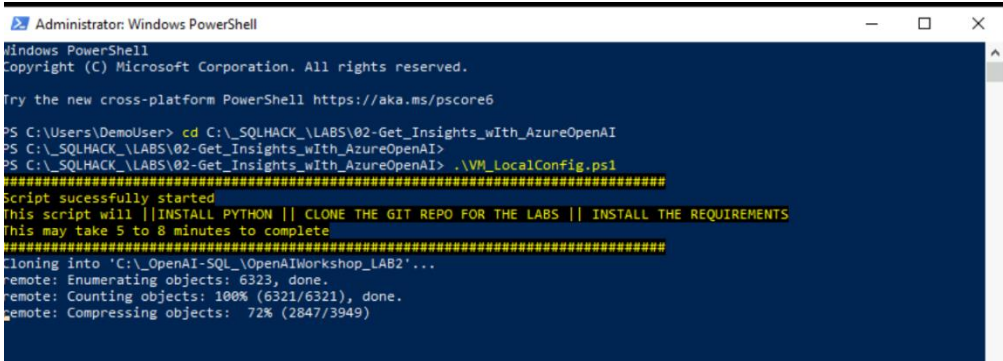

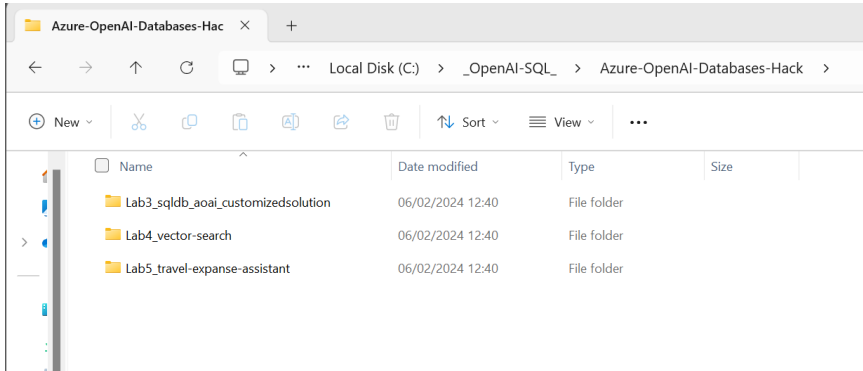

- 1. Install the application locally 2
- 2. Test application and its assistants 8
- 3. Insert new data via natural language 16
- 4. Resolve data quality issues 21
- Appendix 32
 - Azure OpenAI Service..... 32
 - Environment Setup 38

1. Install the application locally

The required environment has been provisioned upfront for this workshop. This includes Visual Studio Code, GIT, Python, and an Azure OpenAI resource. If you are interested in setting up the environment on your local machine, you can refer to the “environment setup” section in the appendix.

3. Narrative	Screenshot	Notes
<p>Switch back to your Team VM.</p> <p>Once you connect to your Virtual Machine, start Windows PowerShell from the Windows start menu, make sure you run it as Administrator (right click on Windows PowerShell).</p>		
<p>In PowerShell command line, navigate to following folder with the command:</p> <p><i>cd C:_SQLHACK_\LABS\02-Get_Insights_with_AzureOpenAI</i></p>		

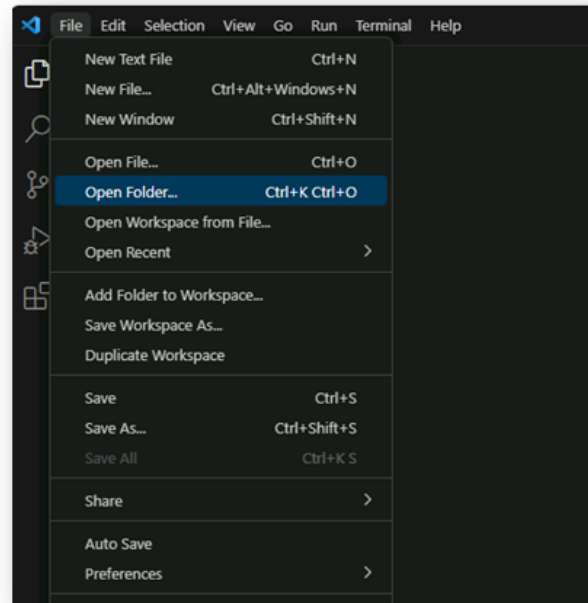

<p>Run the file <code>VM_LocalConfig.ps1</code> by typing in:</p> <p><code>.\VM_LocalConfig.ps1</code></p> <p>Hit enter and let the script run. This might take some time.</p>	 <pre>Administrator: Windows PowerShell Windows PowerShell Copyright (C) Microsoft Corporation. All rights reserved. Try the new cross-platform PowerShell https://aka.ms/pscore6 PS C:\Users\DemoUser> cd C:\SQLHACK\LABS\02-Get_Insights_wIth_AzureOpenAI PS C:\SQLHACK\LABS\02-Get_Insights_wIth_AzureOpenAI> PS C:\SQLHACK\LABS\02-Get_Insights_wIth_AzureOpenAI> .\VM_LocalConfig.ps1 ##### Script successfully started This script will INSTALL PYTHON CLONE THE GIT REPO FOR THE LABS INSTALL THE REQUIREMENTS This may take 5 to 8 minutes to complete ##### Cloning into 'C:_OpenAI-SQL_\OpenAIWorkshop_LAB2'... remote: Enumerating objects: 6323, done. remote: Counting objects: 100% (6321/6321), done. remote: Compressing objects: 72% (2847/3949)</pre>	<p>This script will:</p> <ul style="list-style-type: none">- Install Python- clone the git Repo for the Labs 2 & 3- Install the Python Requirements- Set some environment variables																
<p>The repository with the 3 labs was cloned for you.</p> <p>Check by navigating to path in the file explorer: <code>C:_OpenAI-SQL_\Azure-OpenAI-Databases-Hack</code></p> <p>This is the folder/project you will open in Visual Studio Code.</p>	 <table><thead><tr><th>Name</th><th>Date modified</th><th>Type</th><th>Size</th></tr></thead><tbody><tr><td>Lab3_sqldb_aoad_customizedsolution</td><td>06/02/2024 12:40</td><td>File folder</td><td></td></tr><tr><td>Lab4_vector-search</td><td>06/02/2024 12:40</td><td>File folder</td><td></td></tr><tr><td>Lab5_travel-expense-assistant</td><td>06/02/2024 12:40</td><td>File folder</td><td></td></tr></tbody></table>	Name	Date modified	Type	Size	Lab3_sqldb_aoad_customizedsolution	06/02/2024 12:40	File folder		Lab4_vector-search	06/02/2024 12:40	File folder		Lab5_travel-expense-assistant	06/02/2024 12:40	File folder		
Name	Date modified	Type	Size															
Lab3_sqldb_aoad_customizedsolution	06/02/2024 12:40	File folder																
Lab4_vector-search	06/02/2024 12:40	File folder																
Lab5_travel-expense-assistant	06/02/2024 12:40	File folder																

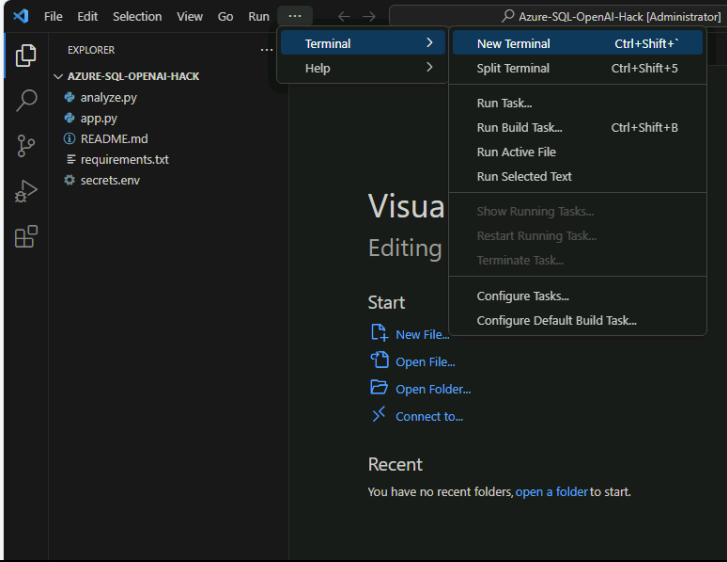

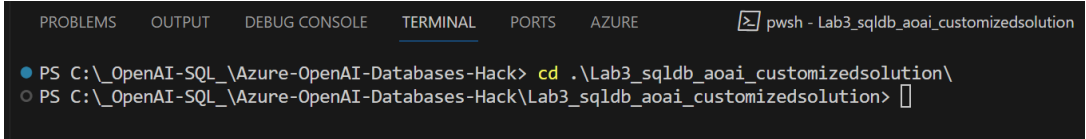

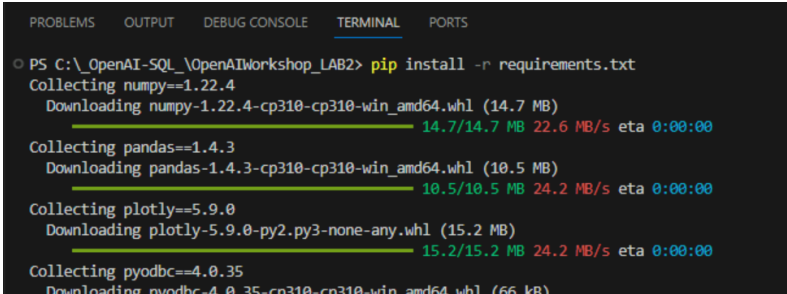

Open **Visual Studio Code** in the Windows start menu.

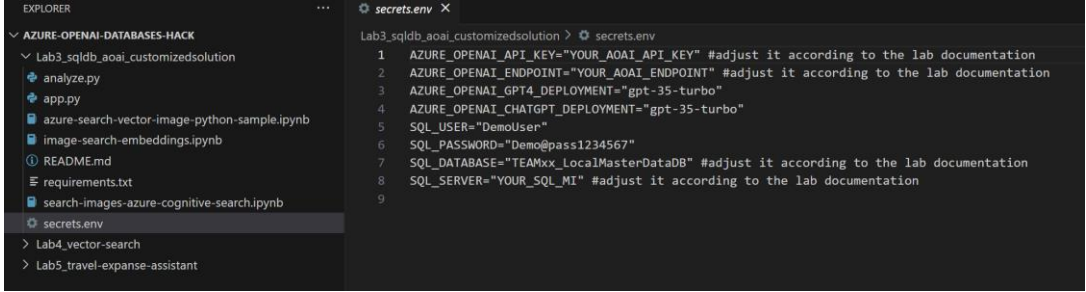

Import the project/folder via **File > Open Folder**.

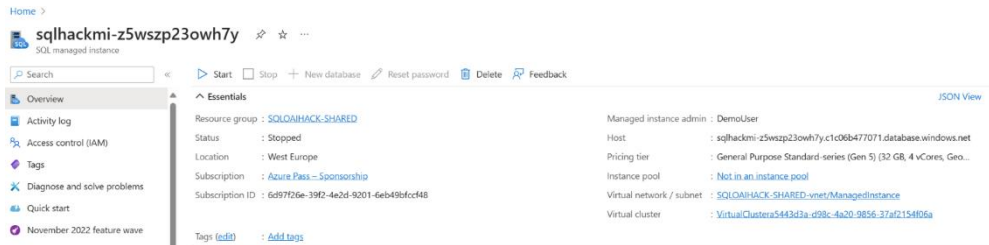

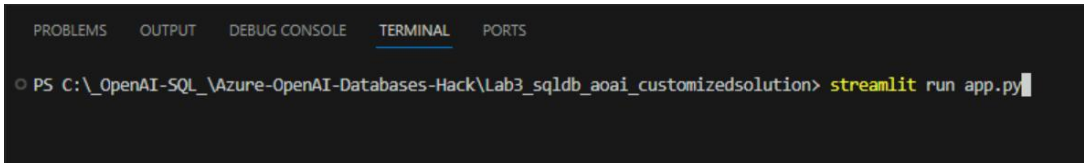

Then select the folder **"C:_OpenAI-SQL_\Azure-OpenAI-Databases-Hack"**

When prompted, check the "Trust the authors of all files" option and click **Yes, I trust the authors**.

<p>Open a terminal via Terminal Tab > New Terminal</p>		
<p>Navigate to the lab 3 subfolder with the cd command:</p> <p>cd .\Lab3_sqldb_aoi_customizedsolution\</p>		
<p>Check if the needed requirements are already installed with the command:</p> <p>pip install -r requirements.txt</p>		

<p>Now set the credential values within the application code (environment file).</p> <p>Navigate to the secrets.env file with the secrets in Lab3 folder.</p> <p>These should be replaced with the values of the services we use from the Hack subscriptions.</p>	 <pre> 1 AZURE_OPENAI_API_KEY="YOUR_AOAI_API_KEY" #adjust it according to the lab documentation 2 AZURE_OPENAI_ENDPOINT="YOUR_AOAI_ENDPOINT" #adjust it according to the lab documentation 3 AZURE_OPENAI_GPT4_DEPLOYMENT="gpt-35-turbo" 4 AZURE_OPENAI_CHATGPT_DEPLOYMENT="gpt-35-turbo" 5 SQL_USER="DemoUser" 6 SQL_PASSWORD="Demo@pass1234567" 7 SQL_DATABASE="TEAMXX_LocalMasterDataDB" #adjust it according to the lab documentation 8 SQL_SERVER="YOUR_SQL_MI" #adjust it according to the lab documentation 9 </pre>																
<p>Update all your credentials according to the ones on the right side. Make sure you fill in the highlighted values.</p> <p>You can copy the credentials on the right side to your env file.</p>	<pre> AZURE_OPENAI_API_KEY="CHOOSE FROM THE TABLE BELOW" AZURE_OPENAI_ENDPOINT="CHOOSE FROM THE TABLE BELOW" AZURE_OPENAI_GPT4_DEPLOYMENT="gpt-4-32k" AZURE_OPENAI_CHATGPT_DEPLOYMENT="gpt-4-32k" SQL_USER="DemoUser" SQL_PASSWORD="Demo@pass1234567" SQL_DATABASE="TEAMXX_LocalMasterDataDB" SQL_SERVER="sqlhackmi-j754o5hum2r36.7a59bf01d694.database.windows.net" </pre>																
<p>For the Azure OpenAI Endpoint + API Key, use the values according to your team number.</p>	<table border="1"> <thead> <tr> <th>TEAM</th><th>AOAI Endpoint</th><th>AOAI API KEY</th></tr> </thead> <tbody> <tr> <td>Team 01 – 05</td><td>https://sqloai-hack-aue.openai.azure.com/</td><td>6b1afdc3eeab4ae4a294de63a6972c06</td></tr> <tr> <td>Team 06 – 10</td><td>https://sqloai-hack-cae.openai.azure.com/</td><td>d935e90e9a8e496390f41b8ec13c11d6</td></tr> <tr> <td>Team 11 – 15</td><td>https://sqloai-hack-swd.openai.azure.com/</td><td>0c59924d91d24708bdbfd6d1f9333599</td></tr> <tr> <td>Team 16 - 20</td><td>https://sqloai-hack-szn.openai.azure.com/</td><td>20ecb856b5c04c3b89b368abccc82dd5</td></tr> </tbody> </table>	TEAM	AOAI Endpoint	AOAI API KEY	Team 01 – 05	https://sqloai-hack-aue.openai.azure.com/	6b1afdc3eeab4ae4a294de63a6972c06	Team 06 – 10	https://sqloai-hack-cae.openai.azure.com/	d935e90e9a8e496390f41b8ec13c11d6	Team 11 – 15	https://sqloai-hack-swd.openai.azure.com/	0c59924d91d24708bdbfd6d1f9333599	Team 16 - 20	https://sqloai-hack-szn.openai.azure.com/	20ecb856b5c04c3b89b368abccc82dd5	
TEAM	AOAI Endpoint	AOAI API KEY															
Team 01 – 05	https://sqloai-hack-aue.openai.azure.com/	6b1afdc3eeab4ae4a294de63a6972c06															
Team 06 – 10	https://sqloai-hack-cae.openai.azure.com/	d935e90e9a8e496390f41b8ec13c11d6															
Team 11 – 15	https://sqloai-hack-swd.openai.azure.com/	0c59924d91d24708bdbfd6d1f9333599															
Team 16 - 20	https://sqloai-hack-szn.openai.azure.com/	20ecb856b5c04c3b89b368abccc82dd5															

<p>For the SQL_DATABASE value, change it to your team's value, e.g. for Team 01, set it to TEAM01_LocalMasterDataDB.</p> <p>Save the updates (press CTRL+S).</p> <p>The secrets.env file will prepopulate the values in the application UI (user interfaces).</p> <p>Later, you can still change the values using the application's User Interface (UI). This will be done in exercise 3 "Test application and its assistants".</p>	<p>Optionally, you can check the SQL_SERVER value again in the Azure Portal. The SQL_SERVER value is the managed instance host name. Example:</p> 	
<p>In Visual Studio Code, in a terminal, make sure you navigate to the lab 3 folder.</p> <p>To run the application run the command:</p> <p>streamlit run app.py</p>		

2. Test application and its assistants

If prompted to give an **e-mail address**, put your demo user address. E.g. `sqloaihackuserXX@M365x04034558.onmicrosoft.com`

An **Edge browser page** opens with settings retrieved from `secrets.env`. You can also manually change the connection information in the user interface if needed.

On the left side, select the assistant app **"SQL Query writing Assistant"**.

Open **Settings**, and make sure you select **"sqlserver"** as the SQL Engine. Click **Submit** to save the settings.

Keep GPT Model as **"ChatGPT"**.

Select **"Show code"** & **"Show prompt"** to check what happened in the background to return the answer.

Side note:

The option **"sqlite"** is a built-in server by Python for you to test out. In this workshop, we will focus on using our own managed instance (option **"sqlserver"**).

Let's test the **SQL Query writing Assistant**. Make sure you have selected this assistant.

Under “**Ask me a question**” below, you can try out your first sample queries in natural language.

Past the sample 1 below and hit the **Submit** button after.

Sample 1: Show me revenue by product in ascending order

The screenshot shows a web application titled "Natural Language Query" running on localhost:8501. The interface is divided into two main sections. On the left, there's a sidebar with options to "Choose the app" (SQL Query Writing Assistant is selected), "Settings", "GPT Model" (set to ChatGPT), "FAQs" (with a dropdown showing "Show me revenue by product in ascending order"), and checkboxes for "Show code" and "Show prompt". Below this is an "Ask me a question" section with a text input containing the query "Show me revenue by product in ascending order" and a "Submit" button. On the right, the results of the query are displayed under the heading "Question: Show me revenue by product in ascending order". The results are shown in a table with two columns: "ProductName" and "Revenue".

	ProductName	Revenue
0	LL Road Seat/Saddle	162.72
1	Mountain Bike Socks, L	513
2	LL Touring Frame - Blue, 58	800.208
3	LL Mountain Frame - Black, 40	1,198.992
4	LL Touring Seat/Saddle	1,480.752
5	ML Mountain Frame-W - Silver, 38	1,529.178
6	LL Touring Handlebars	1,548.624
7	LL Headset	1,949.4
8	ML Touring Seat/Saddle	1,972.656
9	LL Mountain Frame - Black, 52	2,248.11

Sample 2: Show me top 10 most expensive products

Submit

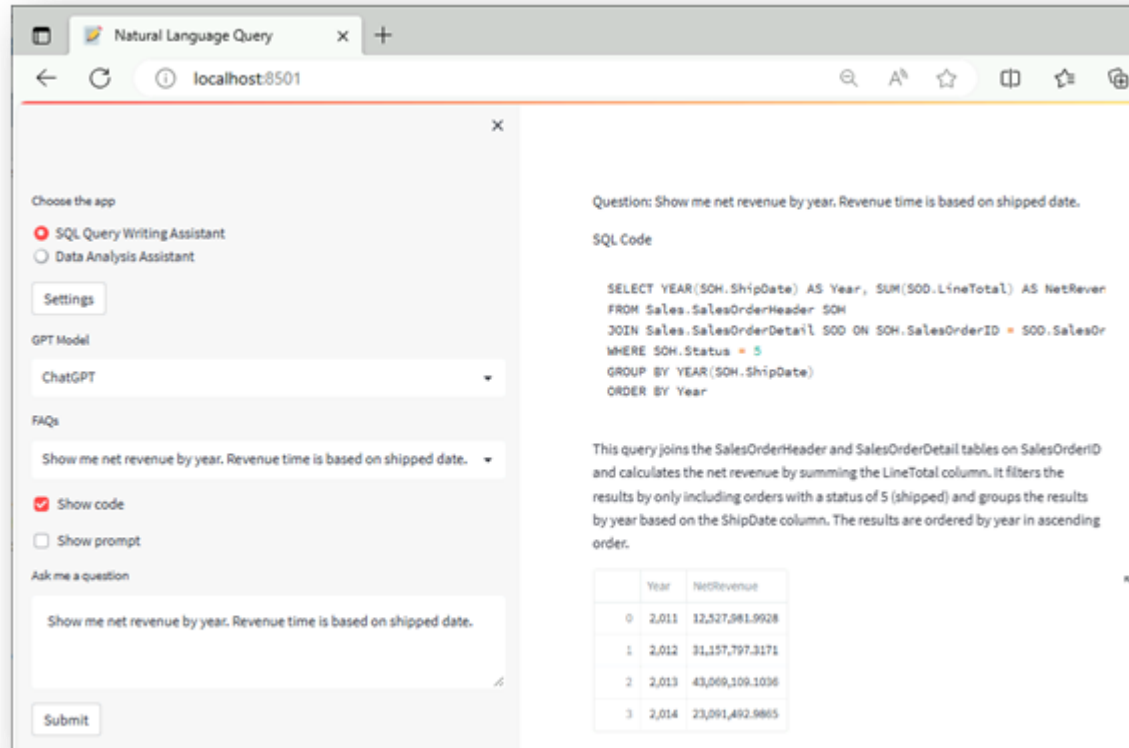

Question: Show me top 10 most expensive products

SQL Code

```
SELECT TOP 10 Name, ListPrice
FROM Production.Product
ORDER BY ListPrice DESC
```

	Name	ListPrice
0	Road-150 Red, 62	3,578.27
1	Road-150 Red, 44	3,578.27
2	Road-150 Red, 48	3,578.27
3	Road-150 Red, 52	3,578.27
4	Road-150 Red, 56	3,578.27
5	Mountain-100 Silver, 38	3,399.99
6	Mountain-100 Silver, 42	3,399.99
7	Mountain-100 Silver, 44	3,399.99
8	Mountain-100 Silver, 48	3,399.99
9	Mountain-100 Black, 38	3,374.99

***Sample 3: Show me net revenue by year.
Revenue time is based on shipped date.***

The screenshot shows a web application titled "Natural Language Query" running on localhost:8501. The interface is divided into a left sidebar and a main content area.

Left Sidebar:

- Choose the app:** Two radio buttons are present: "SQL Query Writing Assistant" (selected) and "Data Analysis Assistant".
- Settings:** A button labeled "Settings".
- GPT Model:** A dropdown menu currently showing "ChatGPT".
- FAQs:** A dropdown menu showing "Show me net revenue by year. Revenue time is based on shipped date.".
- Show code:** A checked checkbox.
- Show prompt:** An unchecked checkbox.
- Ask me a question:** A text input field containing the query "Show me net revenue by year. Revenue time is based on shipped date.".
- Submit:** A button at the bottom of the sidebar.

Main Content Area:

- Question:** "Show me net revenue by year. Revenue time is based on shipped date."
- SQL Code:**

```
SELECT YEAR(SOH.ShipDate) AS Year, SUM(SOD.LineTotal) AS NetRevenue
FROM Sales.SalesOrderHeader SOH
JOIN Sales.SalesOrderDetail SOD ON SOH.SalesOrderID = SOD.SalesOrderID
WHERE SOH.Status = 5
GROUP BY YEAR(SOH.ShipDate)
ORDER BY Year
```
- Description:** "This query joins the SalesOrderHeader and SalesOrderDetail tables on SalesOrderID and calculates the net revenue by summing the LineTotal column. It filters the results by only including orders with a status of 5 (shipped) and groups the results by year based on the ShipDate column. The results are ordered by year in ascending order."
- Results Table:**

	Year	NetRevenue
0	2,011	12,527,981.9928
1	2,012	31,157,797.3171
2	2,013	43,069,109.1036
3	2,014	23,091,492.9865

Sample 4: For each category, get the list of products sold and the total sales amount

The screenshot shows a web application titled "Natural Language Query" running on localhost:8501. The interface is divided into a left sidebar and a main content area.

Left Sidebar:

- Choose the app:**
 - ☒ SQL Query Writing Assistant
 - ☐ Data Analysis Assistant
- Settings:** (button)
- GPT Model:** ChatGPT (dropdown menu)
- FAQs:**
 - For each category, get the list of products sold and the total sales a... (dropdown menu)
 - ☒ Show code
 - ☐ Show prompt
- Ask me a question:**
 - For each category, get the list of products sold and the total sales amount (text input)
 - Submit** (button)

Main Content Area:

Question: For each category, get the list of products sold and the total sales amount

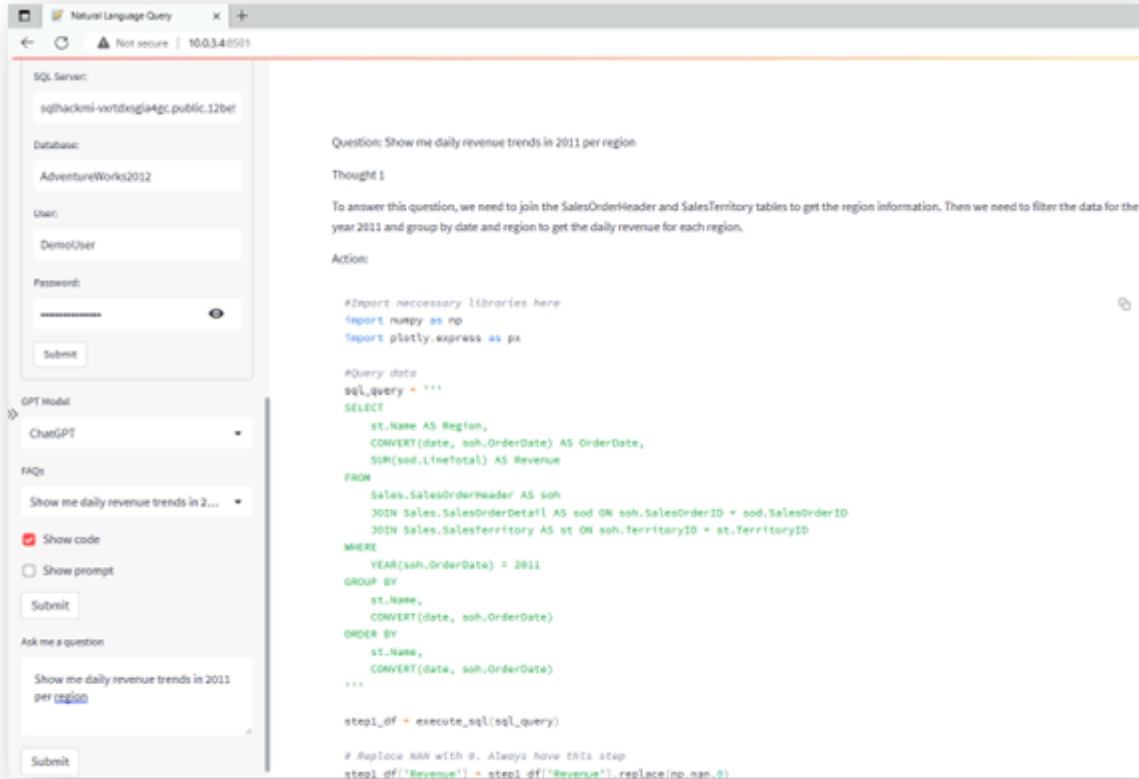

SQL Code:

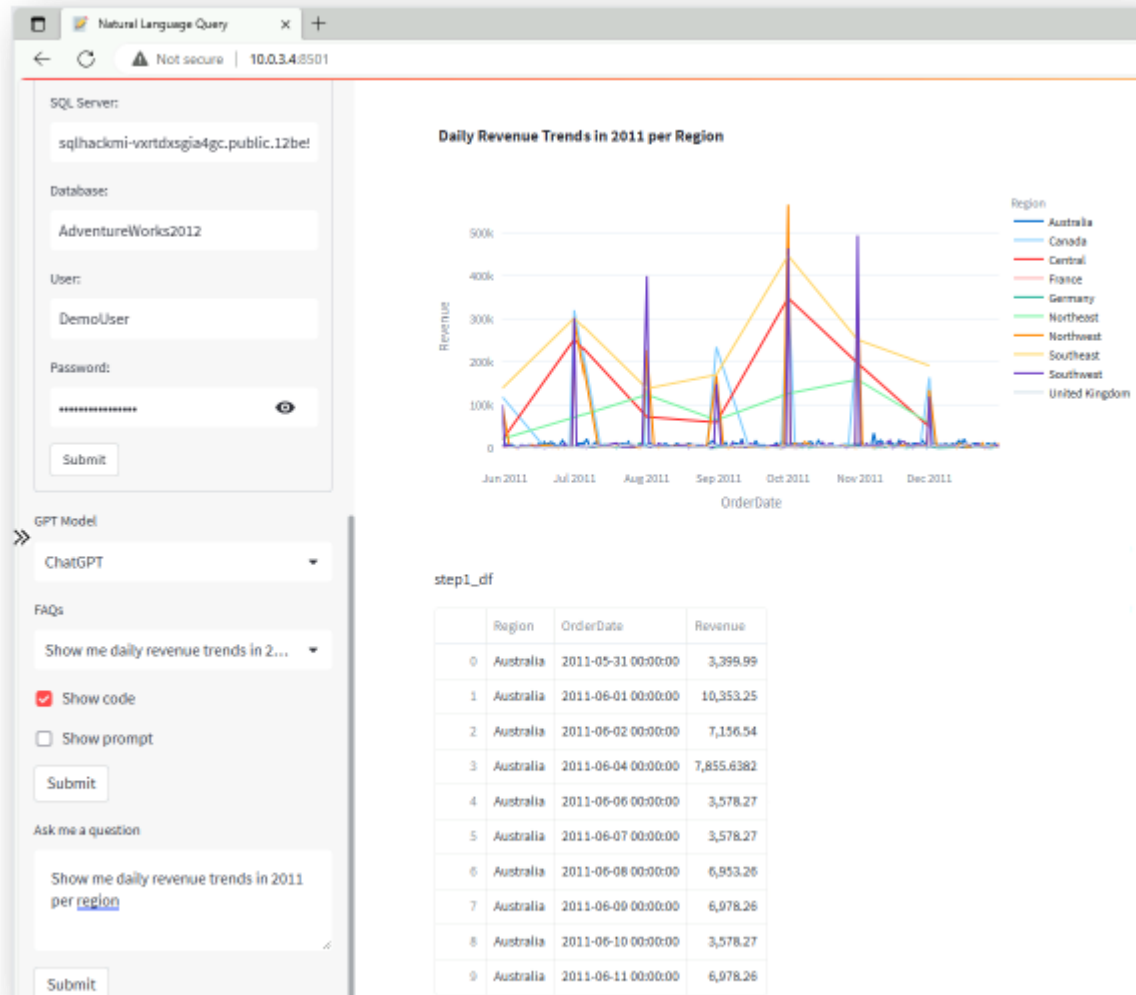

```
SELECT pc.Name AS CategoryName, p.Name AS ProductName, SUM(sod.Li
FROM Production.Product p
JOIN Production.ProductSubcategory pc ON p.ProductSubcategoryID =
JOIN Sales.SalesOrderDetail sod ON p.ProductID = sod.ProductID
GROUP BY pc.Name, p.Name
ORDER BY TotalSalesAmount DESC
```

Results Table:

	CategoryName	ProductName	TotalSalesAmount
0	Mountain Bikes	Mountain-200 Black, 38	4,400,592.8004
1	Mountain Bikes	Mountain-200 Black, 42	4,009,494.7618
2	Mountain Bikes	Mountain-200 Silver, 38	3,693,678.0253
3	Mountain Bikes	Mountain-200 Silver, 42	3,438,478.8604
4	Mountain Bikes	Mountain-200 Silver, 46	3,434,256.9419
5	Mountain Bikes	Mountain-200 Black, 46	3,309,673.2169
6	Road Bikes	Road-250 Black, 44	2,516,857.3149
7	Road Bikes	Road-250 Black, 48	2,347,655.9535
8	Road Bikes	Road-250 Black, 52	2,012,447.775
9	Road Bikes	Road-150 Red, 56	1,847,818.628

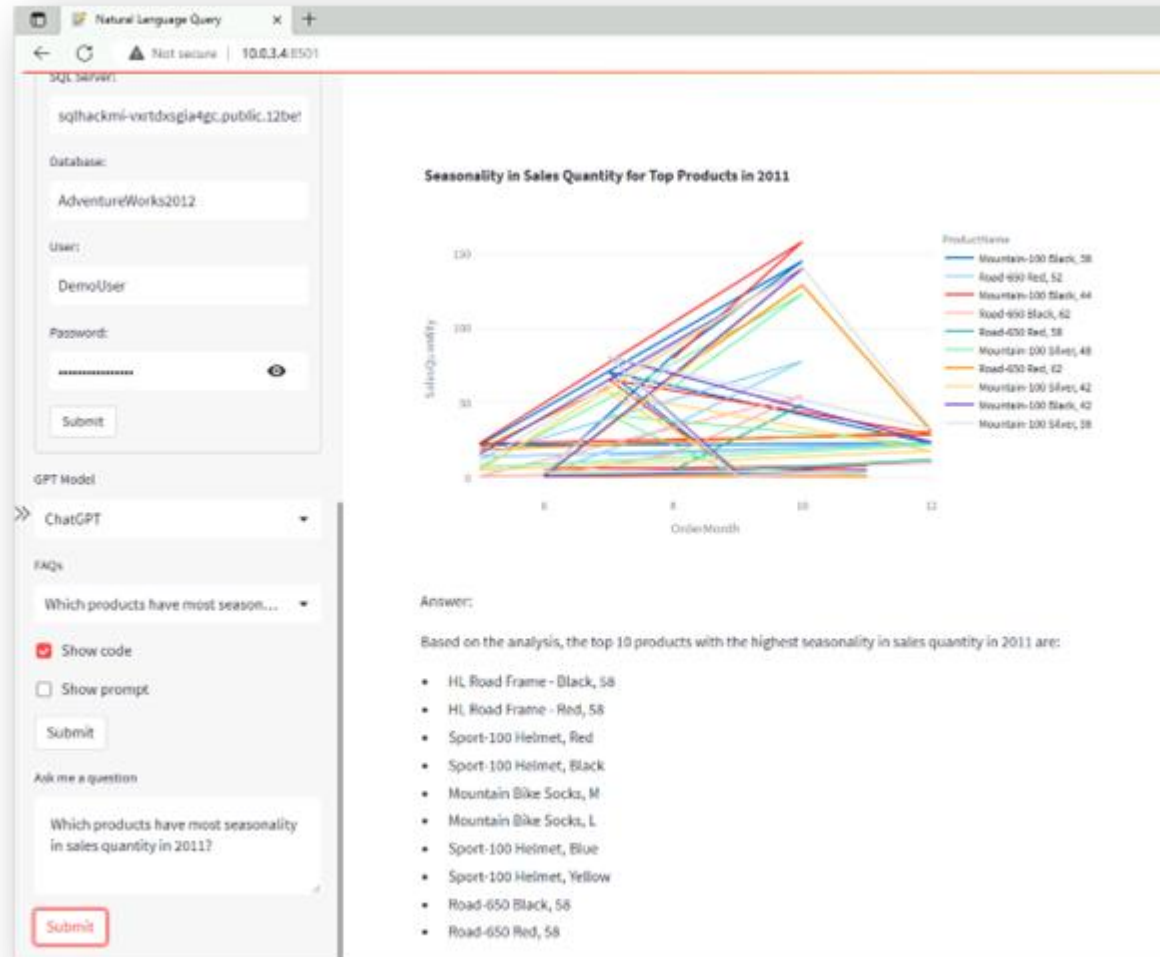

Now, let's test the second assistant "Data Analysis Assistant" to generate further insights – also using natural language.

Narrative	Screenshot	Notes
<p>In the UI, switch to the "Data Analysis Assistant".</p> <p>Make sure to select "sqlserver" as SQL Engine under connecting settings. Then hit submit.</p> <p>Now, you can paste the following query and hit submit:</p> <p>Sample 1: Show me daily revenue trends in 2011 per region</p>	 <p>The screenshot shows the 'Natural Language Query' interface. On the left, the 'SQL Server' configuration is set to 'sqlhackmi-virtixgla4gc.public.12b.e', 'AdventureWorks2012' database, 'DemoUser' user, and a masked password. The 'GPT Model' is set to 'ChatGPT'. The 'FAQs' section shows the question 'Show me daily revenue trends in 2011 per region'. The 'Show code' checkbox is checked, displaying the following SQL query:</p> <pre> -- Import necessary libraries here report_numpy as np report_plotly.express as px #Query data sql_query = """ SELECT st.Name AS Region, CONVERT(date, soh.OrderDate) AS OrderDate, SUM(sod.LineTotal) AS Revenue FROM Sales.SalesOrderHeader AS soh JOIN Sales.SalesOrderDetail AS sod ON soh.SalesOrderID = sod.SalesOrderID JOIN Sales.SalesTerritory AS st ON soh.TerritoryID = st.TerritoryID WHERE YEAR(soh.OrderDate) = 2011 GROUP BY st.Name, CONVERT(date, soh.OrderDate) ORDER BY st.Name, CONVERT(date, soh.OrderDate) """ step1_df = execute_sql(sql_query) # Replace NaN with 0. Always have this step step1_df['Revenue'] = step1_df['Revenue'].replace(np.nan, 0) </pre>	

Sample 2:

Which products have most seasonality in sales quantity in 2011?

3. Insert new data via natural language

The task is dedicated to presentation of diverse ways how the initial logic of communication with your SQL DB data might be extended. For this Hackathon, we have worked with INSERT function (flow is presented below). It is worth mentioning that the function was implemented as a trial by Hackathon presenters.

Use Case Scenario: Recording Scrap Data in LocalMasterDataDB.

Background: LocalMasterDataDB is a manufacturing plant that produces a variety of products. To maintain quality control and minimize waste, the plant has a Scrap table in its database to record and analyze scrapped parts and materials. (Note: there are special systems that collect information about the scrapped parts on the production lines at plants. The presented Use Case is just an example of insert functionality).

Scenario: In the LocalMasterDataDB manufacturing plant, the Scrap Redemption Center plays a crucial role in documenting and managing scrap data. To provide information about the reason of part rejection, the worker enters information about the type of scrap (e.g., "Gouge in metal," " Drill size too large").

Narrative	Screenshot	Notes																												
<p>Select the SQL Query Writing Assistant. Make sure in settings, sqlserver is selected as SQL Engine. Click Submit to save the settings.</p> <p>Check the reasons for the scrap parts with the following prompt:</p> <p><i>Show me the possible reasons of Scrap Parts</i></p>	<div><p>Question: show me the possible reasons of scrap from Scrap Table</p><table><thead><tr><th></th><th>Name</th></tr></thead><tbody><tr><td>0</td><td>Brake assembly not as ordered</td></tr><tr><td>1</td><td>Color incorrect</td></tr><tr><td>2</td><td>Drill pattern incorrect</td></tr><tr><td>3</td><td>Drill size too large</td></tr><tr><td>4</td><td>Drill size too small</td></tr><tr><td>5</td><td>Gouge in metal</td></tr><tr><td>6</td><td>Handling damage</td></tr><tr><td>7</td><td>Paint process failed</td></tr><tr><td>8</td><td>Primer process failed</td></tr><tr><td>9</td><td>Seat assembly not as ordered</td></tr><tr><td>10</td><td>Stress test failed</td></tr><tr><td>11</td><td>Thermoform temperature too high</td></tr><tr><td>12</td><td>Thermoform temperature too low</td></tr></tbody></table></div>		Name	0	Brake assembly not as ordered	1	Color incorrect	2	Drill pattern incorrect	3	Drill size too large	4	Drill size too small	5	Gouge in metal	6	Handling damage	7	Paint process failed	8	Primer process failed	9	Seat assembly not as ordered	10	Stress test failed	11	Thermoform temperature too high	12	Thermoform temperature too low	
	Name																													
0	Brake assembly not as ordered																													
1	Color incorrect																													
2	Drill pattern incorrect																													
3	Drill size too large																													
4	Drill size too small																													
5	Gouge in metal																													
6	Handling damage																													
7	Paint process failed																													
8	Primer process failed																													
9	Seat assembly not as ordered																													
10	Stress test failed																													
11	Thermoform temperature too high																													
12	Thermoform temperature too low																													

Insert with the Staging Table

Narrative	Screenshot/Code	Notes
<p>Back in SSMS (SQL Server Management Studio), open a query window within your team LocalMasterDataDB database (e.g. TEAM01_LocalMasterDataDB). You can do so by right clicking on the DB and selecting “New Query”.</p> <p>Make sure you are in the right context (your Team DB) before executing the query.</p> <p>Create a staging table with the T-SQL statement on the right and insert your TeamXX name for the table.</p>	<pre>CREATE TABLE [TeamXX_StagingTable] (ScrapID INT IDENTITY(1,1) PRIMARY KEY, -- Auto-incremented unique identifier for each scrap record ProductID INT, -- Foreign key to identify the product associated with the scrap ScrappedQty INT, -- Quantity of scrapped parts ScrapReasonID INT, -- Foreign key to specify the reason for scrap ScrapDate DATETIME DEFAULT GETDATE() -- Date and time of scrap (default to current timestamp));</pre>	

Check if the table is already there
with the help of **SQL Query Writing Assistant**.

Use the prompt:
Show me if there is any staging table

Choose the app

☒ SQL Query Writing Assistant

☐ Data Analysis Assistant

☐ SQL Insert Into Assistant

Settings

GPT Model

ChatGPT

FAQs

Show me revenue by product in asc...

☒ Show code

☐ Show prompt

Ask me a question

Show me if there is any staging [table](#)

Question: Show me if there is any staging table

SQL Code

```
SELECT * FROM INFORMATION_SCHEMA.TABLES WHERE TABLE_NAME LIKE
```

	TABLE_CATALOG	TABLE_SCHEMA	TABLE_NAME	TABLI
0	TEAM18_LocalMasterDataDB	dbo	Team18_StagingTable	BASE

Now we are fine to add our first information about the scrap parts (add your values here).

Switch to **SQL Insert Into Assistant**.

Make sure to select “**sqlserver**” as SQL Engine in the Settings and hit **submit**.

Now paste this prompt (adjust your staging table name):

Insert a new item to **TeamXX_StagingTable** where **productID is 1, scrap quantity is 4 and scrap reason is 7**.

The screenshot displays the 'SQL Insert Into Assistant' interface. On the left, the 'Choose the app' section has 'SQL Insert Into Assistant' selected. Below it, a 'Settings' button is visible. The 'GPT Model' is set to 'ChatGPT'. Under 'FAQs', there is a dropdown menu with the text 'Show me revenue by product in asc...'. Further down, there are checkboxes for 'Show code' (checked) and 'Show prompt'. At the bottom of this section is a 'Submit' button. The main area on the right shows a 'Question' about inserting a new item into the 'Team18_StagingTable' with specific values. Below the question, the 'SQL Code' is displayed as an INSERT statement. At the bottom of the main area, a message states: 'Your insert was successful to TEAM18_LocalMasterDataDB. Please check the database to verify.'

Ask me a question

This query will insert a new item to the Team18_StagingTable with ProductID of 1, ScrappedQty of 4, ScrapReasonID of 7, and ScrapDate of the current date and time.

Submit

Question: This query will insert a new item to the Team18_StagingTable with ProductID of 1, ScrappedQty of 4, ScrapReasonID of 7, and ScrapDate of the current date and time.

SQL Code

```
INSERT INTO Team18_StagingTable (ProductID, ScrappedQty, ScrapReasonID, ScrapDate) VALUES (1, 4, 7, GETDATE())
```

Your insert was successful to TEAM18_LocalMasterDataDB. Please check the database to verify.

Insert a new value and check that the primary key (ScrapID) is automatically increased with the following prompt (again, adjust to your staging table name:

*Insert a new item to the **TeamXX_StagingTable** with **ScrappedQty** of 2, **ScrapReasonID** of 9, and **ScrapDate** of the current date and time.*

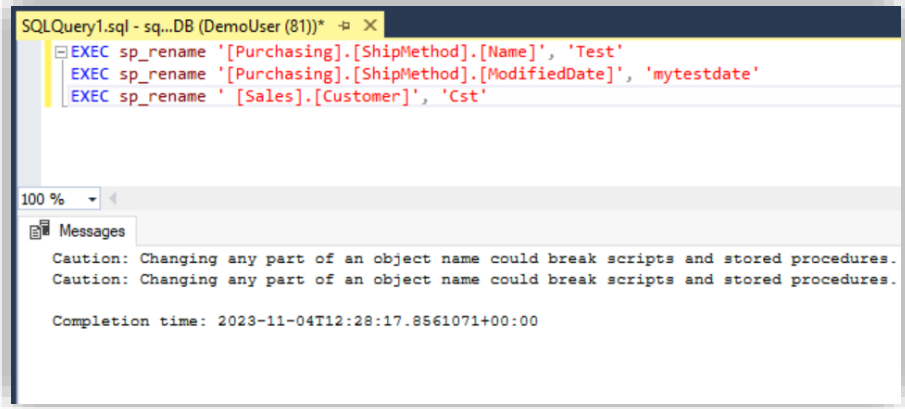

Verify in **SSMS** or in the **SQL Server Writing Assistant** that the item was inserted and there was an automatic increase of ScrapID.

The screenshot shows the SQL Server Writing Assistant interface. On the left, there's a sidebar with options: 'Choose the app' (SQL Query Writing Assistant selected), 'Settings', 'GPT Model' (ChatGPT), 'FAQs' (Show me revenue by product in asc...), and 'Show code' (checked). The main area displays a chat conversation where the user asks 'show me team18 staging table' and the assistant responds with the SQL code 'SELECT * FROM dbo.Team18_StagingTable'. Below the code, a table of data is shown:

	ScrapID	ProductID	ScrappedQty	ScrapReasonID	ScrapDate
0	1	1	4	7	2023-11-04 13:09:52
1	2	None	2	9	2023-11-04 13:11:02

4. Resolve data quality issues

The purpose of this exercise is to understand the importance of ensuring the data which Azure OpenAI works with has the expected quality. First, let us set up the data quality issues by changing object names in our database. We will then analyse the data quality by checking the database object and naming.

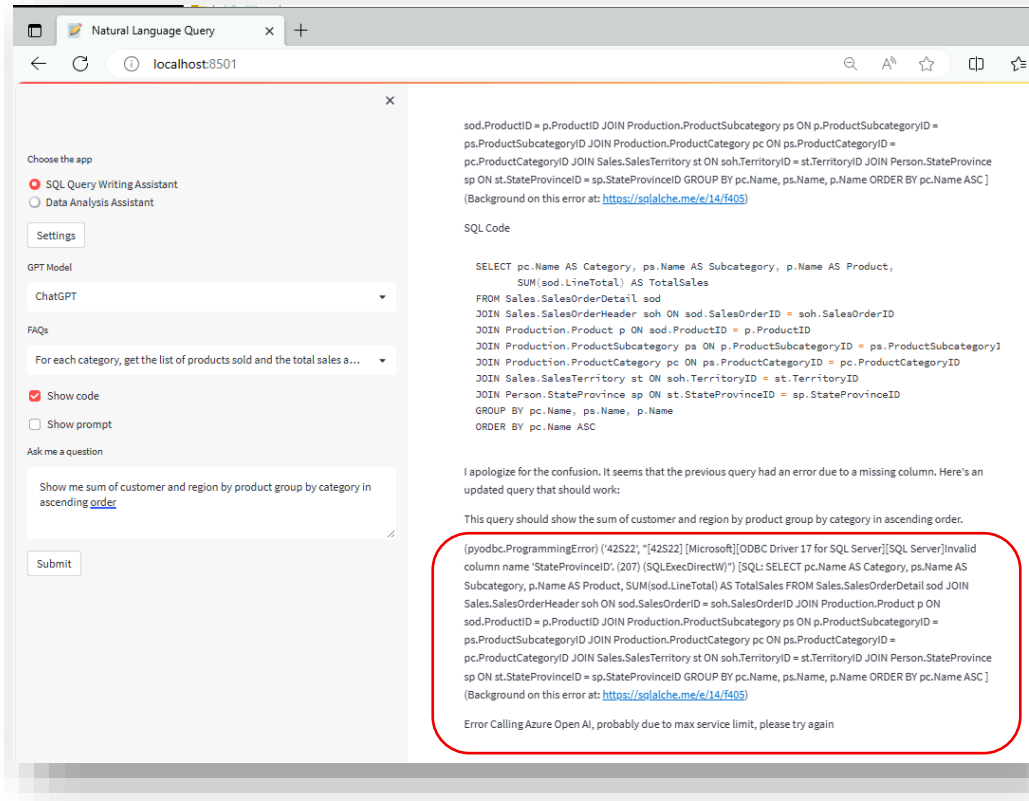

Narrative	Screenshot	Notes
<p>First, let's intentionally create "quality issues within our DB.</p> <p>In SSMS, open a query window on your TeamXX_LocalMasterDataDB and execute the following T-SQL statement:</p> <pre>EXEC sp_rename '[Purchasing].[ShipMethod].[Name]', 'Test' EXEC sp_rename '[Purchasing].[ShipMethod].[ModifiedDate]', 'mytestdate' EXEC sp_rename '[Sales].[Customer]', 'Cst'</pre>		

Now, let's try some samples which will run into errors to understand potential data quality issues we would have to resolve.

Narrative	Screenshot	Notes
<p><u>Sample 1:</u></p> <p>Copy the text in the question box, still using SQL Query Assistant:</p> <p><i>Show me customer by product group by category in ascending order</i></p>	 <p>The screenshot shows a web browser window titled 'Natural Language Query' at 'localhost:8501'. The interface includes a sidebar with options like 'Choose the app' (SQL Query Writing Assistant selected), 'Settings', 'GPT Model' (ChatGPT), and 'FAQs'. The main area displays a SQL query for product sales analysis. Below the query, an error message is shown: 'I apologize for the error. It seems that the Sales.Customer table does not exist in the database. Here's an updated query that should work:'. The updated query is a more complex SQL statement. The error message also includes a link to a background information page: 'https://sqlalche.me/e/14/f405'.</p>	

Notice an **error** is thrown.
You may get a similar message such as “*I apologize for the confusion. It seems there was an error in the previous query. The 'Sales.Customer' table does not exist in the database. Instead, we have a 'Sales.Cst' table that contains the 'CustomerID'.*”.

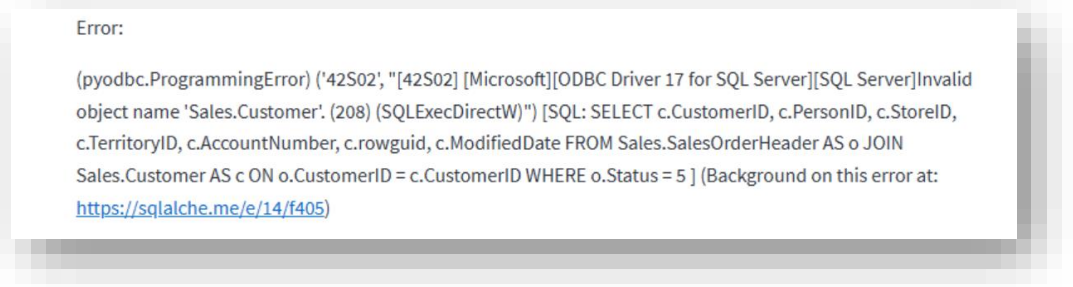

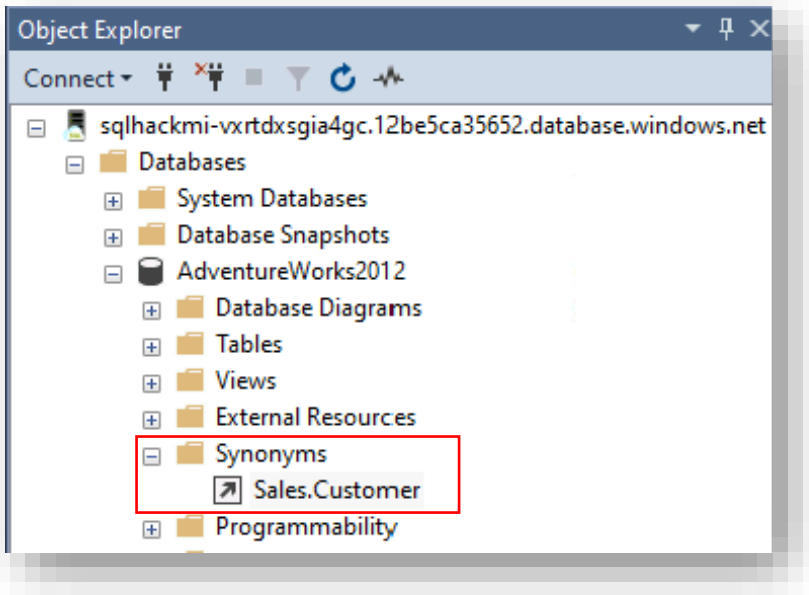

The reason is due to the **object naming** in the database. We purposely changed [Sales].Customer to [Sales].CST. The Azure OpenAI model converts the user query to T-SQL (Transact-SQL). However, since no table with the name “Customer” exists, it cannot query from the table.

The screenshot shows the Natural Language Query interface in a web browser. The left sidebar contains settings for the app (SQL Query Writing Assistant), GPT Model (ChatGPT), and FAQs. The main area displays a SQL query and an error message. The error message is highlighted with a red box and reads:

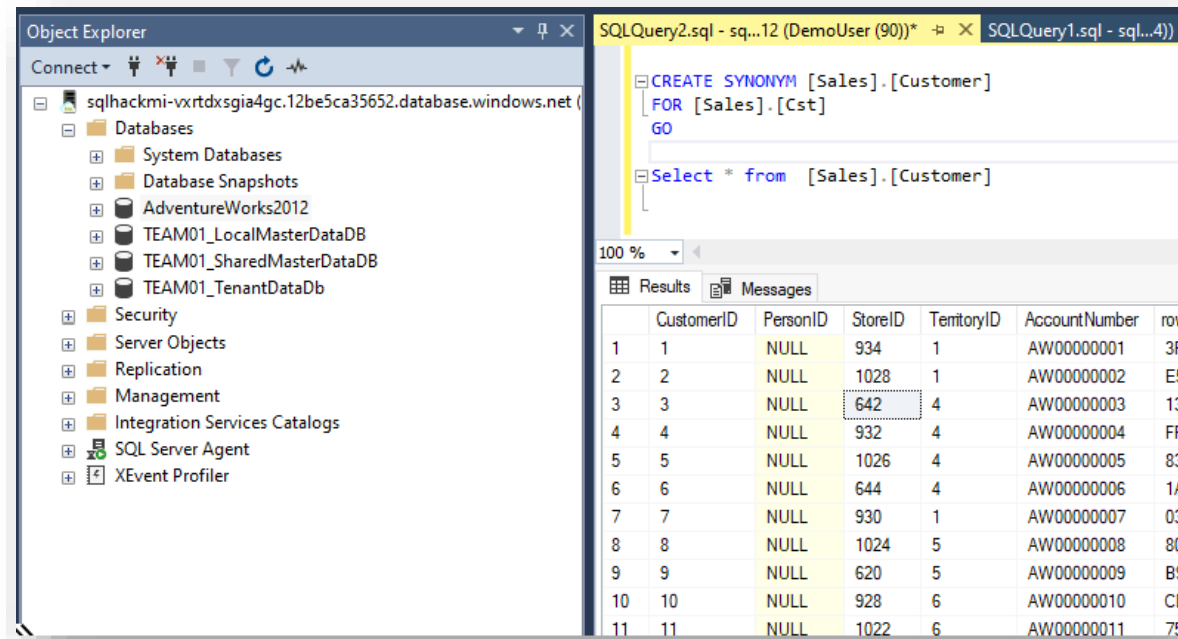

```
[pyodbc.ProgrammingError] ('42S22', "[42S22] [Microsoft][ODBC Driver 17 for SQL Server][SQL Server]Invalid column name 'StateProvinceID'. (207) (SQLExecDirectW)") [SQL: SELECT pc.Name AS Category, ps.Name AS Subcategory, p.Name AS Product, SUM(sod.LineTotal) AS TotalSales FROM Sales.SalesOrderDetail sod JOIN Sales.SalesOrderHeader soh ON sod.SalesOrderID = soh.SalesOrderID JOIN Production.Product p ON sod.ProductID = p.ProductID JOIN Production.ProductSubcategory ps ON p.ProductSubcategoryID = ps.ProductSubcategoryID JOIN Production.ProductCategory pc ON ps.ProductCategoryID = pc.ProductCategoryID JOIN Sales.SalesTerritory st ON soh.TerritoryID = st.TerritoryID JOIN Person.StateProvince sp ON st.StateProvinceID = sp.StateProvinceID GROUP BY pc.Name, ps.Name, p.Name ORDER BY pc.Name ASC] (Background on this error at: https://aka.ms/odbc/42S22)

Error Calling Azure Open AI, probably due to max service limit, please try again
```

<p>You can also test in the Data Analysis Assistant:</p> <p><i>Which customers are most likely to churn?</i></p> <p>This will also throw an error since it also refers to the customer table.</p>		
<p><u>FIX:</u> In SSMS, create a synonym "sales.customer" for the "sales.cst" table. Within your TEAMXX_LocalMasterDataDB, open a new query window and run the following T-SQL statement:</p> <pre>CREATE SYNONYM [Sales].[Customer] FOR [Sales].[Cst] GO</pre> <p>Review the newly created synonym as shown in the screenshot.</p>		<p>Learn more about synonyms in our documentation: CREATE SYNONYM (Transact-SQL) - SQL Server Microsoft Learn</p>

Execute the T-sql query::

*Select * from
[Sales].[Customer]*

The screenshot displays the SQL Server Enterprise Manager interface. On the left, the Object Explorer shows the server hierarchy for 'sqlhackmi-vxrt dxsgia4gc.12be5ca35652.database.windows.net'. The 'Databases' folder is expanded, showing 'System Databases', 'Database Snapshots', 'AdventureWorks2012', 'TEAM01_LocalMasterDataDB', 'TEAM01_SharedMasterDataDB', and 'TEAM01_TenantDataDb'. The 'AdventureWorks2012' database is selected. In the center, the SQL Query Editor shows a T-SQL query:

```
CREATE SYNONYM [Sales].[Customer]
FOR [Sales].[Cst]
GO
Select * from [Sales].[Customer]
```

The query is executed, and the results are displayed in the 'Results' pane. The results table has 11 rows and 6 columns: CustomerID, PersonID, StoreID, TerritoryID, AccountNumber, and row number. The data is as follows:

	CustomerID	PersonID	StoreID	TerritoryID	AccountNumber	row
1	1	NULL	934	1	AW00000001	3F
2	2	NULL	1028	1	AW00000002	E5
3	3	NULL	642	4	AW00000003	13
4	4	NULL	932	4	AW00000004	FF
5	5	NULL	1026	4	AW00000005	83
6	6	NULL	644	4	AW00000006	1A
7	7	NULL	930	1	AW00000007	03
8	8	NULL	1024	5	AW00000008	80
9	9	NULL	620	5	AW00000009	B9
10	10	NULL	928	6	AW00000010	CD
11	11	NULL	1022	6	AW00000011	75

**Submit the question again
and view the result:**

The screenshot shows the 'Natural Language Query' application running on localhost:8501. The interface is divided into a left sidebar and a main content area.

Left Sidebar:

- Choose the app:**
 - ☒ SQL Query Writing Assistant
 - ☐ Data Analysis Assistant
- Settings:** (button)
- GPT Model:** ChatGPT (dropdown menu)
- FAQs:**
 - For each category, get the list of products sold and the total sales a... (dropdown menu)
- ☒ Show code
- ☐ Show prompt
- Ask me a question:**

Show me sum of customer and region by product group by category in ascending [order](#)
- Submit:** (button)

Main Content Area:

Question: Show me sum of customer and region by product group by category in ascending order

SQL Code:

```
SELECT pc.Name AS Category, p.ProductSubcategoryID, ps.Name AS S
p.ProductID, p.Name AS Product,
SUM(sod.OrderQty) AS TotalQuantity,
SUM(sod.LineTotal) AS TotalSales
FROM Sales.SalesOrderDetail sod
JOIN Production.Product p ON sod.ProductID = p.ProductID
JOIN Production.ProductSubcategory ps ON p.ProductSubcategoryID
JOIN Production.ProductCategory pc ON ps.ProductCategoryID = pc.
JOIN Sales.SalesOrderHeader soh ON sod.SalesOrderID = soh.SalesO
JOIN Sales.Customer c ON soh.CustomerID = c.CustomerID
JOIN Person.BusinessEntityAddress bea ON c.PersonID = bea.Busine
JOIN Person.Address a ON bea.AddressID = a.AddressID
JOIN Person.StateProvince sp ON a.StateProvinceID = sp.StateProv
JOIN Sales.SalesTerritory st ON c.TerritoryID = st.TerritoryID
GROUP BY pc.Name, p.ProductSubcategoryID, ps.Name, p.ProductID,
ORDER BY pc.Name ASC
```

Result Table:

	Category	ProductSubcategoryID	Subcategory	ProductID	Product
0	Accessories	28	Bottles and Cages	872	Road Bottl
1	Accessories	37	Tires and Tubes	922	Road Tire
2	Accessories	30	Fenders	878	Fender Set
3	Accessories	37	Tires and Tubes	931	LL Road Ti
4	Accessories	31	Helmets	707	Sport-100
5	Accessories	37	Tires and Tubes	934	Touring Ti
6	Accessories	37	Tires and Tubes	928	LL Mounta
7	Accessories	32	Hydration Packs	880	Hydration
8	Accessories	37	Tires and Tubes	929	ML Mount
9	Accessories	27	Bike Stands	879	All-Purpos

Sample 2

Copy the text in the question box:

Find Quarterly Orders by Product. First column is Product Name, then year then four other columns, each for a quarter group by ship method

The screenshot shows the Natural Language Query interface. On the left sidebar, the 'SQL Query Writing Assistant' is selected. The 'GPT Model' is set to 'ChatGPT'. The 'FAQs' section shows the prompt: 'Find Quarterly Orders by Product. First column is Product Name, then year then four other columns, each for a quarter group by ship method'. The 'Submit' button is visible at the bottom of the sidebar.

The main area displays a SQL query generated by the assistant:

```
pm.Name AS ShipMethod
FROM
  Production.Product p
  JOIN Purchasing.PurchaseOrderDetail pod ON p.ProductID = pod.ProductID
  JOIN Purchasing.PurchaseOrderHeader po ON pod.PurchaseOrderID = po.PurchaseOrderID
  JOIN Purchasing.ShipMethod pm ON po.ShipMethodID = pm.ShipMethodID
GROUP BY
  p.Name,
  YEAR(po.OrderDate),
  pm.Name
ORDER BY
  p.Name,
  YEAR(po.OrderDate),
  pm.Name
```

Below the query, an error message is displayed:

It looks like there is an error in the query. The error message suggests that the columns `Name` and `Quantity` do not exist in the result set. Here's an updated query that should work:

This query should work assuming the other tables exist in the database.

```
pyodbc.ProgrammingError: ('42S22', "[42S22] [Microsoft][ODBC Driver 17 for SQL Server][SQL Server]Invalid column name 'Name'. (207) [SQLExecDirectW]; [42S22] [Microsoft][ODBC Driver 17 for SQL Server][SQL Server]Invalid column name 'Name'. (207); [42S22] [Microsoft][ODBC Driver 17 for SQL Server][SQL Server]Invalid column name 'Name'. (207)"); [SQL: SELECT p.Name AS ProductName, YEAR(po.OrderDate) AS OrderYear, SUM(CASE WHEN DATEPART(QUARTER, po.OrderDate) = 1 THEN pod.OrderQty ELSE 0 END) AS Q1, SUM(CASE WHEN DATEPART(QUARTER, po.OrderDate) = 2 THEN pod.OrderQty ELSE 0 END) AS Q2, SUM(CASE WHEN DATEPART(QUARTER, po.OrderDate) = 3 THEN pod.OrderQty ELSE 0 END) AS Q3, SUM(CASE WHEN DATEPART(QUARTER, po.OrderDate) = 4 THEN pod.OrderQty ELSE 0 END) AS Q4, pm.Name AS ShipMethod FROM Production.Product p JOIN Purchasing.PurchaseOrderDetail pod ON p.ProductID = pod.ProductID JOIN Purchasing.PurchaseOrderHeader po ON pod.PurchaseOrderID = po.PurchaseOrderID JOIN Purchasing.ShipMethod pm ON po.ShipMethodID = pm.ShipMethodID GROUP BY p.Name, YEAR(po.OrderDate), pm.Name ] (Background on this error at: https://sqlalche.me/e/14/f405)
```

Cannot find the column "name" and therefore takes "ShipMethodID" as a reference.

I apologize for the error. It seems that the `Sales.ShipMethod` table is not present in the database. Here's an updated query that groups by `soh.ShipMethodID` instead:

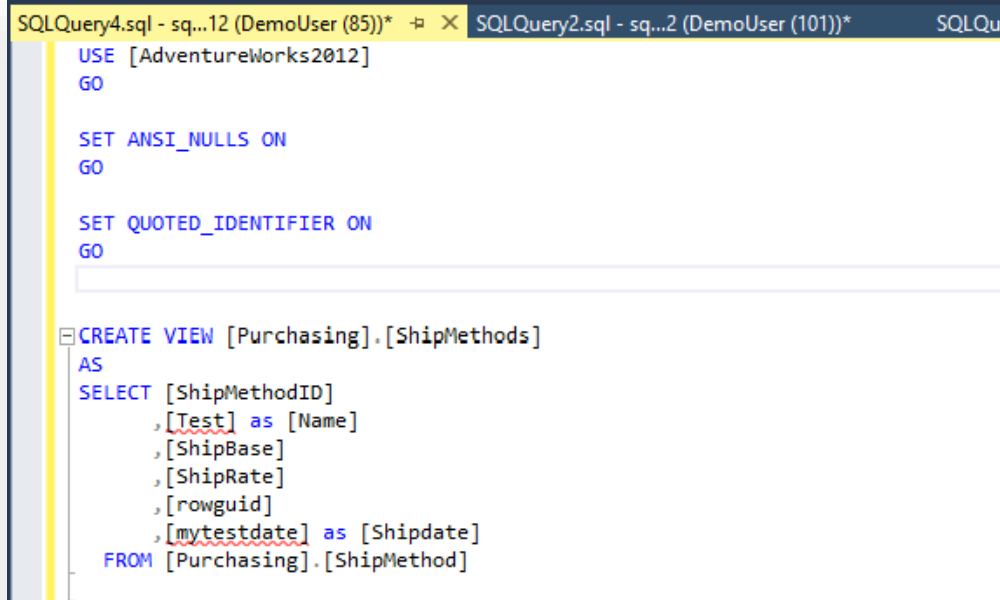

This should group the results by `soh.ShipMethodID` instead of `sm.Name`.

	ProductName	OrderYear	Q1	Q2	Q3	Q4	ShipMethodID
0	All-Purpose Bike Stand	2,013	0	6	65	65	1
1	All-Purpose Bike Stand	2,014	66	47	0	0	1
2	AWC Logo Cap	2,011	0	40	240	265	5
3	AWC Logo Cap	2,012	326	674	608	440	5
4	AWC Logo Cap	2,013	0	54	474	544	1
5	AWC Logo Cap	2,013	514	854	846	482	5
6	AWC Logo Cap	2,014	594	524	0	0	1
7	AWC Logo Cap	2,014	614	218	0	0	5
8	Bike Wash - Dissolver	2,013	0	22	209	247	1
9	Bike Wash - Dissolver	2,013	0	564	672	451	5

In SSMS, **create a View** via t-sql (adjust to your team DB):

```
USE [TEAMXX_LocalMasterDataDB]
GO
SET ANSI_NULLS ON
GO
SET QUOTED_IDENTIFIER ON
GO

CREATE VIEW [Purchasing].[ShipMethods]
AS
SELECT [ShipMethodID] , [Test] as [Name]
, [ShipBase] , [ShipRate] , [rowguid]
, [mytestdate] as [Shipdate]
FROM [Purchasing].[ShipMethod]
```

The screenshot shows a SQL Server Enterprise Manager window with two tabs: 'SQLQuery4.sql - sq...12 (DemoUser (85))' and 'SQLQuery2.sql - sq...2 (DemoUser (101))'. The active tab displays the following T-SQL code:

```
USE [AdventureWorks2012]
GO

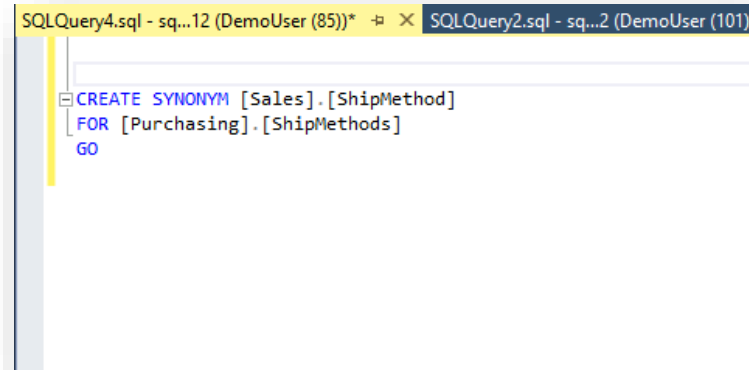

SET ANSI_NULLS ON
GO

SET QUOTED_IDENTIFIER ON
GO

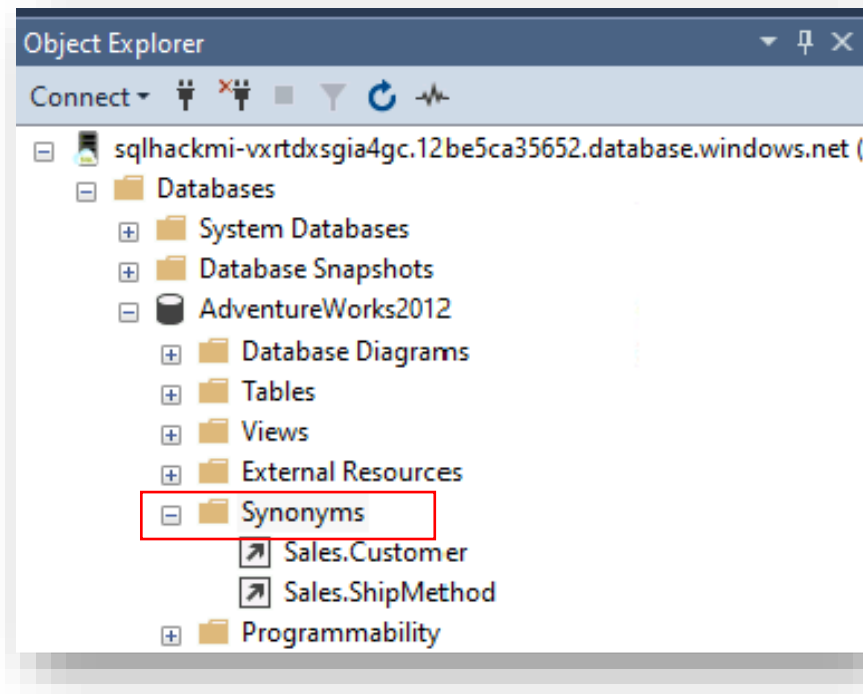

CREATE VIEW [Purchasing].[ShipMethods]
AS
SELECT [ShipMethodID]
, [Test] as [Name]
, [ShipBase]
, [ShipRate]
, [rowguid]
, [mytestdate] as [Shipdate]
FROM [Purchasing].[ShipMethod]
```

Create a synonym:

```
CREATE SYNONYM [Sales].[ShipMethod]
FOR [Purchasing].[ShipMethods]
GO
```

Review the synonym

Submit the question again and view the result

Find Quarterly Orders by Product. First column is Product Name, then year then four other columns, each for a quarter group by ship method

The screenshot shows the 'Natural Language Query' web application. On the left sidebar, the 'SQL Query Writing Assistant' is selected. The 'GPT Model' is set to 'ChatGPT'. In the 'FAQs' section, the question 'Find Quarterly Orders by Product. First column is Product Name, then year then four other columns, each for a quarter group by ship method' is highlighted with a red box. The 'Submit' button is at the bottom of the sidebar.

The main area displays the generated SQL code for the query:

```
SELECT
  p.Name AS ProductName,
  YEAR(soh.OrderDate) AS OrderYear,
  SUM(CASE WHEN DATEPART(QUARTER, soh.OrderDate) = 1 THEN sod.OrderQty ELSE 0 END) AS Q1,
  SUM(CASE WHEN DATEPART(QUARTER, soh.OrderDate) = 2 THEN sod.OrderQty ELSE 0 END) AS Q2,
  SUM(CASE WHEN DATEPART(QUARTER, soh.OrderDate) = 3 THEN sod.OrderQty ELSE 0 END) AS Q3,
  SUM(CASE WHEN DATEPART(QUARTER, soh.OrderDate) = 4 THEN sod.OrderQty ELSE 0 END) AS Q4,
  sm.Name AS ShipMethodName
FROM
  Sales.SalesOrderHeader AS soh
  JOIN Sales.SalesOrderDetail AS sod ON soh.SalesOrderID = sod.SalesOrderID
  JOIN Production.Product AS p ON sod.ProductID = p.ProductID
  JOIN Sales.ShipMethod AS sm ON soh.ShipMethodID = sm.ShipMethodID
GROUP BY
  p.Name,
  YEAR(soh.OrderDate),
  sm.Name
ORDER BY
  p.Name,
  YEAR(soh.OrderDate),
  sm.Name
```

Below the SQL code, the results are displayed in a table. The 'ShipMethodName' column for the last three rows is highlighted with a red box.

	ProductName	OrderYear	Q1	Q2	Q3	Q4	ShipMethodName
0	All-Purpose Bike Stand	2,013	0	6	65	65	XRQ - TRUCK GROUND
1	All-Purpose Bike Stand	2,014	66	47	0	0	XRQ - TRUCK GROUND
2	AWC Logo Cap	2,011	0	40	240	265	CARGO TRANSPORT 5
3	AWC Logo Cap	2,012	326	674	608	440	CARGO TRANSPORT 5
4	AWC Logo Cap	2,013	514	854	846	482	CARGO TRANSPORT 5
5	AWC Logo Cap	2,013	0	54	474	544	XRQ - TRUCK GROUND

Appendix

(OPTIONAL) Manual Deployment: You can follow the instructions below if you want to manually deploy the Azure OpenAI resource as well as the environment setup including Visual Studio Code, Git, Python, etc.

Azure OpenAI Service

Create an Azure OpenAI resource in an Azure subscription with a **GPT-35-Turbo** deployment and preferably a **GPT-4** deployment. Here we provide options for using both, but GPT-4 should be used to address more difficult & vague questions. We assume that your GPT-4 and ChatGPT deployments are in the same Azure Open AI resource.

Narrative	Screenshot	Notes
<p>See documentation for instructions:</p> <p>How-to: Create and deploy an Azure OpenAI Service resource - Azure OpenAI Microsoft Learn</p>		

The screenshot shows the 'Create Azure OpenAI' wizard in the Microsoft Azure portal, specifically the 'Network' tab. The breadcrumb navigation at the top reads 'Home > Azure AI services > Azure OpenAI >'. The page title is 'Create Azure OpenAI'. Below the title, there are four steps: 'Basics' (completed), 'Network' (active), 'Tags', and 'Review + submit'. A blue information box states: 'Configure network security for your Azure AI services resource.' Below this, the 'Type' section has three radio button options: 'All networks, including the internet, can access this resource.' (selected), 'Selected networks, configure network security for your Azure AI services resource.', and 'Disabled, no networks can access this resource. You could configure private endpoint connections that will be the exclusive way to access this resource.' At the bottom, there are 'Previous' and 'Next' buttons.

Create a python environment with

version from 3.7 and 3.10

Download Python:

<https://www.python.org/downloads/>

Installation Python

Important:

- Python and the pip package manager must be in the path in Windows for the setup scripts to work.
- Ensure you can run `python --version` from console. On Ubuntu, you might need to run `sudo apt install python-is-python3` to link `python` to `python3`.
